1 Introduction

This is the documentation for the `mandi`,¹ which is designed primarily for students in introductory physics courses. This document serves to document what commands `mandi` provides and does not necessarily fully demonstrate how students would use them. There is a separate document that serves that purpose.

1.1 Loading the Package

Load `mandi` as you would any package in your preamble.

```
\usepackage[options]{mandi}
```

1.2 The Package Version

`\mandiversion`

Typesets the current version and build date.

The version is `\mandiversion` and is a stable build.

The version is v3.0.0f dated 2021-02-27 and is a stable build.

1.3 Package Options

N 2021-01-30

N 2021-01-30

`units`=(*type of unit*) (initially unspecified, set to `alternate`)

`preciseconstants`=(*boolean*) (initially unspecified, set to `false`)

Now `mandi` uses a key-value interface for options. The `units` key can be set to `base`, `derived`, or `alternate`. The `preciseconstants` key is always either `true` or `false`.

1.4 The `mandisetaup` Command

N 2021-02-17

`\mandisetaup{<options>}`

Command to set package options on the fly after loadtime. This can be done in the preamble or inside the `\begin{document}... \end{document}` environment.

```
\mandisetaup{units=base}
```

¹The package name can be pronounced either with two syllables, to rhyme with *candy*, or with three syllables, as *M and I*.

2 Intelligent Commands for Physical Quantities and Constants

2.1 Physical Quantities

2.1.1 Typesetting Physical Quantities

Typesetting physical quantities and constants using semantically appropriate names, along with the correct [SI units](#), is the core function of **mandi**. Take momentum as the prototypical physical quantity in an introductory physics course.

`\momentum` $\{\langle magnitude \rangle\}$
`\momentumvector` $\{\langle c_1, \dots, c_n \rangle\}$
`\vectormomentum` $\{\langle c_1, \dots, c_n \rangle\}$

Command for momentum and its vector variant. The default units will depend on the options passed to **mandi** at load time. Alternate units are the default. Other units can be forced as demonstrated. The vector variant can take more than three components. Note the other variants for the quantity's value and units.

<code>\momentum{5}</code>	<code>\%</code>	$5 \text{ kg} \cdot \text{m} / \text{s}$
<code>\momentumvalue{5}</code>	<code>\%</code>	5
<code>\momentumbaseunits{5}</code>	<code>\%</code>	$5 \text{ m} \cdot \text{kg} \cdot \text{s}^{-1}$
<code>\momentumderivedunits{5}</code>	<code>\%</code>	$5 \text{ N} \cdot \text{s}$
<code>\momentumalternateunits{5}</code>	<code>\%</code>	$5 \text{ kg} \cdot \text{m} / \text{s}$
<code>\momentumonlybaseunits</code>	<code>\%</code>	$\text{m} \cdot \text{kg} \cdot \text{s}^{-1}$
<code>\momentumonlyderivedunits</code>	<code>\%</code>	$\text{N} \cdot \text{s}$
<code>\momentumonlyalternateunits</code>	<code>\%</code>	$\text{kg} \cdot \text{m} / \text{s}$
<code>\vectormomentum{2,3,4}</code>	<code>\%</code>	$\langle 2, 3, 4 \rangle \text{ kg} \cdot \text{m} / \text{s}$
<code>\momentumvector{2,3,4}</code>	<code>\%</code>	$\langle 2, 3, 4 \rangle \text{ kg} \cdot \text{m} / \text{s}$
<code>\momentum{\mivector{2,3,4}}</code>		$\langle 2, 3, 4 \rangle \text{ kg} \cdot \text{m} / \text{s}$

Commands that include the name of a physical quantity typeset units, so they shouldn't be used for algebraic or symbolic values of components. For example, one shouldn't use `\vectormomentum{mv_x,mv_y,mv_z}` but instead the generic `\mivector{mv_x,mv_y,mv_z}` instead.

2.1.2 Checking Physical Quantities

`\checkquantity` $\{\langle name \rangle\}$

Command to check and typeset the command, base units, derived units, and alternate units of a defined physical quantity.

2.1.3 Commands For Predefined Physical Quantities

Every other defined physical quantity can be treated similarly. Just replace **momentum** with the quantity's name. Obviously, the variants that begin with **\vector** will not be defined for scalar quantities. Here are all the physical quantities, with all their units, defined in **mandi**. Remember that units are not present with symbolic (algebraic) quantities, so do not use the **\vector** variants of these commands for symbolic components. Use **\mivector** ^{P. 32} instead.

`\renewvectorquantity{<name>}{<base units>}[<derived units>][<alternate units>]`

Command to define/redefine a new/existing vector quantity. If the derived or alternate units are omitted, they are defined to be the same as the base units. Do not use both this command and `\newsclarquantity` or `\renewsclarquantity` to define/redefine a quantity.

2.1.6 Setting Global Units

U 2021-02-26

U 2021-02-26

```

\alwaysusebaseunits
\alwaysusederivedunits
\alwaysusealternateunits

```

Modal commands (switches) for setting the default unit form for the entire document. When `mandi` is loaded, one of these three commands is executed depending on whether the optional `units` key is provided. See the section on loading the package for details. Alternate units are the default because they are the most likely ones to be seen in introductory physics textbooks.

2.1.7 Setting Units for a Single Instance

U 2021-02-26

U 2021-02-26

U 2021-02-26

```

\hereusebaseunits{<content>}
\hereusederivedunits{<content>}
\hereusedalternateunits{<content>}

```

Commands for setting the unit form on the fly for a single instance. The example uses momentum and the Coulomb constant, but they work for any defined quantity and constant.

<code>\hereusebaseunits{\momentum{5}}</code>	<code>\\</code>	$5 \text{ m} \cdot \text{kg} \cdot \text{s}^{-1}$
<code>\hereusederivedunits{\momentum{5}}</code>	<code>\\</code>	$5 \text{ N} \cdot \text{s}$
<code>\hereusealternateunits{\momentum{5}}</code>	<code>\\</code>	$5 \text{ kg} \cdot \text{m} / \text{s}$
<code>\hereusebaseunits{\oofpez}</code>	<code>\\</code>	$9 \times 10^9 \text{ m}^3 \cdot \text{kg} \cdot \text{s}^{-4} \cdot \text{A}^{-2}$
<code>\hereusederivedunits{\oofpez}</code>	<code>\\</code>	$9 \times 10^9 \text{ m} / \text{F}$
<code>\hereusealternateunits{\oofpez}</code>		$9 \times 10^9 \text{ N} \cdot \text{m}^2 / \text{C}^2$

2.1.8 Setting Units in an Environment

U 2021-02-26

```
\begin{usebaseunits}                                     (use base units)
  <environment content>
```

U 2021-02-26

```
\begin{usederivedunits}                                   (use derived units)
  <environment content>
```

U 2021-02-26

```
\begin{usealternateunits}                                (use alternate units)
  <environment content>
\end{usealternateunits}
```

Inside these environments units are changed for the duration of the environment regardless of the global default setting.

2.2 Physical Constants

2.2.1 Typesetting Physical Constants

Take the quantity $\frac{1}{4\pi\epsilon_0}$, sometimes called the [Coulomb constant](#), as the prototypical [physical constant](#) in an introductory physics course. Here are all the ways to access this quantity in **mandi**. As you can see, these commands are almost identical to the corresponding commands for physical quantities.

`\oofpez`

Command for the Coulomb constant. The constant's numerical precision and default units will depend on the options passed to **mandi** at load time. Alternate units and approximate numerical values are the defaults. Other units can be forced as demonstrated.

<code>\oofpezonlyderivedunits</code>	<code>\</code>	m / F
<code>\oofpezonlyalternateunits</code>	<code>\</code>	$\text{N} \cdot \text{m}^2 / \text{C}^2$

2.2.2 Checking Physical Constants

U 2021-02-26

`\checkconstant{(name)}`

Command to check and typeset the constant's name, base units, derived units, alternate units, mathematical symbol, approximate value, and precise value.

2.2.3 Commands For Predefined Physical Constants

Every other defined physical constant can be treated similarly. Just replace `\oofpez` with the constant's name. Unfortunately, there is no universal agreement on the names of every constant so consult the next section for the names that have been used. Here are all the physical constants, with all their units, defined in `mandi`. The constants `\coulombconstant`^{P.21} and `\biotsavartconstant` are defined as semantic aliases for, respectively, `\oofpez`^{P.23} and `\mzofp`^{P.23}.

3.3 The `glowscriptinline` and `vpythoninline` Commands

`\glowscriptinline{GlowScript code}`

`\vpythoninline{VPython code}`

Typesets a small, in-line snippet of code. The snippet should be less than one line long.

`\GlowScript\` programs begin with `\glowscriptinline{GlowScript 3.0 VPython}`
and `\VPython\` programs begin with `\vpythoninline{from vpython import *}`.

GlowScript programs begin with `GlowScript 3.0 VPython` and VPython programs begin with `from vpython import *`.

4 Commands for Writing Physics Problem Solutions

4.1 Introductory Needs

mandi provides a collection of commands physics students can use for writing problem solutions. This new version focuses on the most frequently needed tools. These commands should always be used in math mode.

4.1.1 Traditional Vector Notation

`\vec{<symbol>}[<labels>]`

(use this variant for boldface notation)

`\vec*{<symbol>}[<labels>]`

(use this variant for arrow notation)

Powerful and intelligent command for symbolic vector notation. The mandatory argument is the symbol for the vector quantity. The optional label(s) consists of superscripts and/or subscripts and can be mathematical or textual in nature. If textual, be sure to wrap them in `\symup{...}` for proper typesetting. The starred variant gives arrow notation whereas without the star you get boldface notation. Subscript and superscript labels can be arbitrarily mixed, and order doesn't matter.

```
\( \vec{p} \)           \\\
\(\ \vec{p}_{2} \)      \\\
\(\ \vec{p}^{\symup{ball}} \) \\\
\(\ \vec{p}_{\symup{final}} \) \\\
\(\ \vec{p}^{\symup{ball}}_{\symup{final}} \) \\\
\(\ \vec{p}^{\symup{final}}_{\symup{ball}} \) \\\
\(\ \vec*{p} \)          \\\
```

p_{ball}
*p*_→

`\zerovec`

(use this variant for boldface notation)

`\zerovec*`

(use this variant for arrow notation)

Command for typesetting the zero vector. The starred version gives arrow notation whereas without the star you get boldface notation.

`\(\zerovec \) \\\`
`\(\zerovec* \) \\\`

$\mathbf{0}$
 $\vec{0}$

`\Dvec{<symbol>}`

(use this variant for boldface notation)

`\Dvec*{<symbol>}`

(use this variant for arrow notation)

Command for typesetting the change in a vector. The starred variant gives arrow notation whereas without the star you get boldface notation. Subscript and superscript labels are not yet supported so if you need the symbol for the change in a subscripted or superscripted vector, just put `\changein` in front of it. This command must be used in math mode.

`\(\Dvec{r} \) \\\`
`\(\Dvec*{r} \) \\\`

$\Delta \mathbf{r}$
 $\Delta \vec{r}$

`\dirvec{<symbol>}`

(use this variant for boldface notation)

`\dirvec*{<symbol>}`

(use this variant for arrow notation)

Command for typesetting the direction of a vector. The starred variant gives arrow notation whereas without the star you get boldface notation. Subscript and superscript labels are not yet supported.

`\(\dirvec{r} \) \\\`
`\(\dirvec*{r} \) \\\`

$\hat{\mathbf{r}}$
 $\hat{\vec{r}}$

`\magvec{<symbol>}`

(use this variant for boldface notation)

`\magvec*{<symbol>}`

(use this variant for arrow notation)

Command for typesetting the magnitude of a vector. The starred variant gives arrow notation whereas without the star you get boldface notation. Subscript and superscript labels are not yet supported.

`\(\magvec{r} \) \\\`
`\(\magvec*{r} \) \\\`

$\|\mathbf{r}\|$
 $\|\vec{r}\|$

`\mivector[<delimiter>]{<c1, ..., cn>}[<units>]`

Typesets a vector as either numeric or symbolic components with an optional unit (for numerical components only). There can be more than three components. The delimiter used in the list of components can be specified; the default is a comma. The notation mirrors that of *Matter & Interactions*.

`\mivector{p_0,p_1,p_2,p_3} \\\`
`\mivector{\gamma m v_x,\gamma m v_y,\gamma m v_z} \\\`
`\mivector{\frac{Q_1 Q_2}{x^2},0,0} \\\`
`\mivector{-1,0,0} \\\`
`\mivector{-1,0,0}[\velocityonlyderivedunits] \\\`
`\mivector{-1,0,0}[\meter\per\second] \\\`
`\velocity{\mivector{-1,0,0}} \\\`

$\langle p_0, p_1, p_2, p_3 \rangle$
 $\langle \gamma m v_x, \gamma m v_y, \gamma m v_z \rangle$
 $\left\langle \frac{Q_1 Q_2}{x^2}, 0, 0 \right\rangle$
 $\langle -1, 0, 0 \rangle$
 $\langle -1, 0, 0 \rangle \text{ m / s}$
 $\langle -1, 0, 0 \rangle \text{ m / s}$
 $\langle -1, 0, 0 \rangle \text{ m / s}$

N 2021-02-21
N 2021-02-21

`\direction[⟨delimiter⟩]{⟨c1, ..., cn⟩}`
`\unitvector[⟨delimiter⟩]{⟨c1, ..., cn⟩}`

Semantic aliases for `\mivector` → P. 32.

`\direction{\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}} \\\`
`\unitvector{\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}}`

$$\left\langle \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}} \right\rangle$$

4.1.2 Coordinate-Free and Index Notation

Beyond the current level of introductory physics, we need intelligent commands for typesetting vector and tensor symbols and components suitable for both coordinate-free and index notations.

`\veccomp{⟨symbol⟩}` (use this variant for coordinate-free vector notation)
`\veccomp*{⟨symbol⟩}` (use this variant for index vector notation)
`\tencomp{⟨symbol⟩}` (use this variant for coordinate-free tensor notation)
`\tencomp*{⟨symbol⟩}` (use this variant for index tensor notation)

Conforms to ISO 80000-2 notation.

`\(\veccomp{r} \) \\\`
`\(\veccomp*{r} \) \\\`
`\(\tencomp{r} \) \\\`
`\(\tencomp*{r} \) \\\`

(use this variant for unnumbered steps)

This environment is only for mathematical solutions. The starred variant omits numbering of steps. See the examples.

```

\begin{physicssolution}
  x &= y + z \\
  z &= x - y \\
  y &= x - z
\end{physicssolution}
\begin{physicssolution*}

$$z = x - y \quad (2)$$

$$y = x - z \quad (3)$$

$$x = y + z$$

$$z = x - y$$

$$y = x - z$$

U 2012-02-26

\reason{(reason)}

Provides an annotation in a step-by-step solution. Keep reasons short and to the point. Wrap mathematical content in math mode.

```

\begin{physicssolution}
  x &= y + z \reason{This is a reason.} \\
  z &= x - y \reason{This is a reason too.} \\
  y &= x - z \reason{final answer}
\end{physicssolution}
\begin{physicssolution*}
  x &= y + z \reason{This is a reason.} \\
  z &= x - y \reason{This is a reason too.} \\
  y &= x - z \reason{final answer}
\end{physicssolution*}

```

$$x = y + z \quad \text{This is a reason.} \quad (4)$$

$$z = x - y \quad \text{This is a reason too.} \quad (5)$$

$$y = x - z \quad \text{final answer} \quad (6)$$

$$x = y + z \quad \text{This is a reason.}$$

$$z = x - y \quad \text{This is a reason too.}$$

$$y = x - z \quad \text{final answer}$$

When writing solutions, remember that the [physicssolution](#)^{P.34} environment is *only* for mathematical content, not textual content or explanations.

4.2 Intermediate and Advanced Needs

`\colvec[⟨delimiter⟩]{⟨c1, ..., cn⟩}`
`\rowvec[⟨delimiter⟩]{⟨c1, ..., cn⟩}`

Typesets column vectors and row vectors as numeric or symbolic components. There can be more than three components. The delimiter used in the list of components can be specified; the default is a comma.

`\(\colvec{1,2,3} \) \\\`
`\(\rowvec{1,2,3} \) \\\`

$$\begin{pmatrix} 1 \\ 2 \\ 3 \end{pmatrix}$$

$$(1 \quad 2 \quad 3)$$

`\valence{⟨index⟩}{⟨index⟩}`
`\valence*{⟨index⟩}{⟨index⟩}`

Typesets tensor valence. The starred variant typesets it horizontally.

A vector is a `\(\valence{1}{0} \) tensor. \\\`
A vector is a `\(\valence*{1}{0} \) tensor. \\\`

A vector is a $\begin{pmatrix} 1 \\ 0 \end{pmatrix}$ tensor.
A vector is a $(1, 0)$ tensor.

`\contraction{⟨slot,slot⟩}`
`\contraction*{⟨slot,slot⟩}`

Typesets tensor contraction in coordinate-free notation. There is no standard on this so we assert one here.

`\(\contraction{1,2} \) \\\`
`\(\contraction*{1,2} \) \\\`

$$\mathbb{C}_{1,2}$$

$$C_{1,2}$$

`\slot[⟨vector⟩]`
`\slot*[⟨vector⟩]`

An intelligent slot command for coordinate-free vector and tensor notation. The starred variants suppress the underscore.

`\((\slot) \) \\\`
`\((\slot[\vec{a}]) \) \\\`
`\((\slot*) \) \\\`
`\((\slot*[\vec{a}]) \) \\\`

$$(\quad)$$

$$(\underline{\boldsymbol{a}})$$

$$(\quad)$$

$$(\boldsymbol{a})$$

4.3 Useful Math Commands

`\tento{⟨number⟩}`
`\timestento{⟨number⟩}`

`\xtento{⟨number⟩}`

Commands for powers of ten and scientific notation.

<code>\tento{-4}</code>	<code>\</code>	10^{-4}
<code>3\timestento{8}</code>	<code>\</code>	3×10^8
<code>3\xtento{8}</code>		3×10^8

`\changein`

Semantic alias for `\Delta`.

<code>\(\changein t) \</code>	Δt
<code>\(\changein \vec{p}) \</code>	$\Delta \mathbf{p}$

<code>\doublebars [⟨size⟩] {⟨quantity⟩}</code>	(double bars)

<code>\parentheses [⟨size⟩] {⟨quantity⟩}</code>	(parentheses)
<code>\parentheses* [⟨size⟩] {⟨quantity⟩}</code>	(parentheses for fractions)
<code>\squarebrackets [⟨size⟩] {⟨quantity⟩}</code>	(square brackets)
<code>\squarebrackets* [⟨size⟩] {⟨quantity⟩}</code>	(square brackets for fractions)
<code>\curlybraces [⟨size⟩] {⟨quantity⟩}</code>	(curly braces)
<code>\curlybraces* [⟨size⟩] {⟨quantity⟩}</code>	(curly braces for fractions)

If no argument is given, a placeholder is provided. Sizers like `\big`, `\Big`, `\bigg`, and `\Bigg` can be optionally specified. Beginners are encouraged not to use them. See the [mathtools](#) package documentation for details.

5 Commands Specific to *Matter & Interactions*

mandi comes with an accessory package `mandiexp` which includes commands specific to *Matter & Interactions*². The commands are primarily for typesetting mathematical expressions used in the text. Use of `mandiexp` is optional and so must be manually loaded by including the line `\usepackage{mandiexp}` in your document's preamble.

Define the package version and date for global use, exploiting the fact that in a .sty file there is now no need for `\makeatletter` and `\makeatother`. This simplifies defining internal commands, with @ in the name, that are not for the user to know about.

Set up the fonts to be consistent with ISO 80000-2 notation. The `unicode-math` package loads the `fontspec` and `xparse` packages. Note that `xparse` is now part of the L^AT_EX kernel. Because `unicode-math` is required, all documents using `mandi` must be compiled with an engine that supports Unicode. We recommend LuaL^AT_EX.

mandi now has a key-value interface, implemented with `pgfopts` and `pgfkeys`. There are two options: `units`^{→P.6}, with values `base`, `derived`, or `alternate` selects the default form of units `preciseconstants`^{→P.6}, with values `true` and `false`, selects precise numerical values for constants rather than approximate values.

First, define the keys. The key handlers require certain commands defined by the unit engine, and thus must be defined and processed after the unit engine code.

```

305 \newif\ifusingpreciseconstants
306 \pgfkeys{%
307   /mandi/options/.cd,
308   initial@setup/.style={%
309     /mandi/options/buffered@units/.initial=alternate,%
310   },%
311   initial@setup,%
312   preciseconstants/.is if=usingpreciseconstants,%
313   units/.is choice,%
314   units/.default=derived,%
315   units/alternate/.style={/mandi/options/buffered@units=alternate},%
316   units/base/.style={/mandi/options/buffered@units=base},%
317   units/derived/.style={/mandi/options/buffered@units=derived},%
318 }%

```

Process the options.

```

319 \ProcessPgfPackageOptions{/mandi/options}

```

Write a banner to the console showing the options in use. The value of the `units`^{→P.6} key is used in situ to set the default units.

Define every quantity we need in introductory physics, alphabetically for convenience. This is really the core feature of **mandi** that no other package offers. There are commands for quantities that have no dimensions or units, and these quantities are defined for semantic completeness.

A better, intelligent coordinate-free `\vecP.31` command. Note the use of the `e_{~}` type of optional argument. This accounts for much of the flexibility and power of this command. Also note the use of the TeX primitives `\sb{}` and `\sp{}`. Why doesn't it work when I put spaces around #3 or #4? Because outside of `\ExplSyntaxOn...\ExplSyntaxOff`, the `_` character has a different catcode and is treated as a mathematical entity.
