To all of the students who have learned LaTeX in my introductory physics courses over the years, I say a heartfelt thank you. You have contributed directly to the state of this software and to its use in introductory physics courses and to innovating how physics is taught.

1 Introduction

This is the documentation for the mandi,[1] which is designed primarily for students in introductory physics courses. This document serves to document what commands mandi provides and does not necessarily fully demonstrate how students would use them. There is a separate document that serves that purpose.

1.1 Loading the Package

Load mandi as you would any package in your preamble.

```
\usepackage[options]{mandi}
```

\mandiversion

> Typesets the current version and build date.

```
The version is \mandiversion\ and is a stable build.
```
- -
The version is v3.0.0h dated 2021-03-14 and is a stable build.

1.2 Package Options

N 2021-01-30 **units**=⟨*type of unit*⟩   (initially unspecified, set to **alternate**)
N 2021-01-30 **preciseconstants**=⟨*boolean*⟩   (initially unspecified, set to **false**)

> Now mandi uses a key-value interface for options. The **units** key can be set to **base**, **derived**, or **alternate**. The **preciseconstants** key is always either **true** or **false**.

1.3 The `mandisetup` Command

N 2021-02-17 **\mandisetup**{⟨*options*⟩}

> Command to set package options on the fly after loadtime. This can be done in the preamble or inside the \begin{document}...\end{document} environment.

```
\mandisetup{units=base}
```

---

[1]The package name can be pronounced either with two syllables, to rhyme with *candy*, or with three syllables, as *M and I*.

2 Student/Instructor Quick Guide

Use `\vec`$^{\rightarrow \text{P. }35}$ to typeset the symbol for a vector. Use `\magnitude`$^{\rightarrow \text{P. }38}$ to typeset the symbol for a vector's magnitude. Use `\dirvec`$^{\rightarrow \text{P. }35}$ to typeset the symbol for a vector's direction. Use `\changein`$^{\rightarrow \text{P. }36}$ to typeset the symbol for the change in a vector or scalar. Use `\zerovec`$^{\rightarrow \text{P. }35}$ to typeset the zero vector. Use `\timestento`$^{\rightarrow \text{P. }39}$ to typeset scientific notation.

`\( \vec{p} \) or \( \vec*{p} \) \\`	$\boldsymbol{p}$ or $\vec{p}$
`\( \vec{p}_{\symup{final}} \) or \( \vec*{p}_{\symup{final}} \) \\`	$\boldsymbol{p}_{\text{final}}$ or $\vec{p}_{\text{final}}$
`\( \magnitude{\vec{p}} \) or \( \magnitude*{\vec{p}_{\symup{final}}} \) \\`	$\lVert\boldsymbol{p}\rVert$ or $\lVert\boldsymbol{p}_{\text{final}}\rVert$
`\( \dirvec{p} \) or \( \dirvec*{p} \) \\`	$\widehat{\boldsymbol{p}}$ or $\widehat{p}$
`\( \changein \vec{p} \) or \( \changein t \) \\`	$\varDelta\boldsymbol{p}$ or $\varDelta t$
`\( \zerovec \) or \( \zerovec* \) \\`	$\boldsymbol{0}$ or $\vec{0}$
`\( 6.02\timestento{-19} \)`	6.02×10^{-19}

Use a `physical quantity's`$^{\rightarrow \text{P. }8}$ name to typeset a magnitude and that quantity's units. If the quantity is a vector, you can add `vector` either to the beginning or the end of the quantity's name. For example, if you want momentum, use `\momentum`$^{\rightarrow \text{P. }8}$ and its variants.

`\( \momentum{7.071} \) \\`	$7.071\,\text{kg} \cdot \text{m} / \text{s}$
`\( \vectormomentum{3,-4,5} \) \\`	$\langle 3, -4, 5\rangle\,\text{kg} \cdot \text{m} / \text{s}$
`\( \momentumvector{3,-4,5} \)`	$\langle 3, -4, 5\rangle\,\text{kg} \cdot \text{m} / \text{s}$

Use a `physical constant's`$^{\rightarrow \text{P. }22}$ name to typeset its numerical value and units. Append `mathsymbol` to the constant's name to get its mathematical symbol. For example, if you want to typeset the vacuum permittivity, use `\vacuumpermittivity`$^{\rightarrow \text{P. }28}$ and its variant.

`\( \vacuumpermittivitymathsymbol = \vacuumpermittivity \)`	$\epsilon_{\text{o}} = 9 \times 10^{-12}\,\text{C}^2 / \text{N} \cdot \text{m}^2$

Use `\mivector`$^{\rightarrow \text{P. }36}$ to typeset symbolic vectors with components. Use the aliases `\direction`$^{\rightarrow \text{P. }36}$ or `\unitvector`$^{\rightarrow \text{P. }36}$ to typeset a direction or unit vector.

`\( \mivector{\slot,\slot,\slot} \) or \( \mivector{p_x,p_y,p_z} \) \\`
`\( \direction{\frac{1}{\sqrt{3}},\frac{1}{\sqrt{3}},\frac{1}{\sqrt{3}}} \) or`
`\( \unitvector{\frac{1}{\sqrt{3}},\frac{1}{\sqrt{3}},\frac{1}{\sqrt{3}}} \)`

$\langle \underline{\quad}, \underline{\quad}, \underline{\quad}\rangle$ or $\langle p_x, p_y, p_z\rangle$
$\left\langle \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}\right\rangle$ or $\left\langle \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}\right\rangle$

Use `glowscriptblock`$^{\rightarrow \text{P. }29}$ to typeset a GlowScript program. Use `\vpythonfile`$^{\rightarrow \text{P. }32}$ to typeset a VPython program file. Use `physicssolution`$^{\rightarrow \text{P. }41}$ to typeset step-by-step mathematical solutions.

3 Intelligent Commands for Physical Quantities and Constants

3.1 Physical Quantities

3.1.1 Typesetting Physical Quantities

Typesetting physical quantities and constants using semantically appropriate names, along with the correct SI units, is the core function of mandi. Take momentum as the prototypical physical quantity in an introductory physics course.

\momentum{⟨*magnitude*⟩}
\momentumvector{⟨$c_1, \dots, c_n$⟩}
\vectormomentum{⟨$c_1, \dots, c_n$⟩}

> Command for momentum and its vector variant. The default units will depend on the options passed to mandi at load time. Alternate units are the default. Other units can be forced as demonstrated. The vector variant can take more than three components. Note the other variants for the quantity's value and units.

```
                                          5 kg · m / s
\momentum{5}                    \\        5
\momentumvalue{5}               \\        5 m · kg · s⁻¹
\momentumbaseunits{5}           \\        5 N · s
\momentumderivedunits{5}        \\        5 kg · m / s
\momentumalternateunits{5}      \\        m · kg · s⁻¹
\momentumonlybaseunits          \\        N · s
\momentumonlyderivedunits       \\        kg · m / s
\momentumonlyalternateunits     \\        ⟨2, 3, 4⟩ kg · m / s
\vectormomentum{2,3,4}          \\        ⟨2, 3, 4⟩ kg · m / s
\momentumvector{2,3,4}          \\        ⟨2, 3, 4⟩ kg · m / s
\momentum{\mivector{2,3,4}}
```

The display column shows:

$5\,\mathrm{kg \cdot m / s}$
5
$5\,\mathrm{m \cdot kg \cdot s^{-1}}$
$5\,\mathrm{N \cdot s}$
$5\,\mathrm{kg \cdot m / s}$
$\mathrm{m \cdot kg \cdot s^{-1}}$
$\mathrm{N \cdot s}$
$\mathrm{kg \cdot m / s}$
$\langle 2, 3, 4 \rangle\,\mathrm{kg \cdot m / s}$
$\langle 2, 3, 4 \rangle\,\mathrm{kg \cdot m / s}$
$\langle 2, 3, 4 \rangle\,\mathrm{kg \cdot m / s}$

Commands that include the name of a physical quantity typeset units, so they shouldn't be used for algebraic or symbolic values of components. For example, one shouldn't use `\vectormomentum{mv_x,mv_y,mv_z}` but instead the generic `\mivector{mv_x,mv_y,mv_z}` instead.

3.1.2 Checking Physical Quantities

\checkquantity{⟨*name*⟩}

> Command to check and typeset the command, base units, derived units, and alternate units of a defined physical quantity.

3.1.3 Commands For Predefined Physical Quantities

Every other defined physical quantity can be treated similarly. Just replace momentum with the quantity's name. Obviously, the variants that begin with \vector will not be defined for scalar quantities. Here are all the physical quantities, with all their units, defined in mandi. Rememeber that units are not present with symbolic (algebraic) quantities, so do not use the \vector variants of these commands for symbolic components. Use \mivector instead.

3.1.6 Changing Units

`\alwaysusebaseunits`
`\alwaysusederivedunits`
`\alwaysusealternateunits`

Modal commands (switches) for setting the default unit form for the entire document. When mandi

is loaded, one of these three commands is executed depending on whether the optional `units` key is provided. See the section on loading the package for details. Alternate units are the default because they are the most likely ones to be seen in introductory physics textbooks.

\hereusebaseunits{⟨*content*⟩}
\hereusederivedunits{⟨*content*⟩}
\hereusedalternateunits{⟨*content*⟩}

Commands for setting the unit form on the fly for a single instance. The example uses momentum and the Coulomb constant, but they work for any defined quantity and constant.

```
\hereusebaseunits{\momentum{5}}       \\
\hereusederivedunits{\momentum{5}}     \\
\hereusealternateunits{\momentum{5}} \\
\hereusebaseunits{\oofpez}             \\
\hereusederivedunits{\oofpez}           \\
\hereusealternateunits{\oofpez}
```

$5\,\mathrm{N}\cdot\mathrm{s}$
$5\,\mathrm{kg}\cdot\mathrm{m}/\mathrm{s}$
$9\times10^{9}\,\mathrm{m}^{3}\cdot\mathrm{kg}\cdot\mathrm{s}^{-4}\cdot\mathrm{A}^{-2}$
$9\times10^{9}\,\mathrm{m}/\mathrm{F}$
$9\times10^{9}\,\mathrm{N}\cdot\mathrm{m}^{2}/\mathrm{C}^{2}$

\begin{**usebaseunits**}   (use base units)
  ⟨*environment content*⟩
\end{**usebaseunits**}
\begin{**usederivedunits**}   (use derived units)
  ⟨*environment content*⟩
\end{**usederivedunits**}
\begin{**usealternateunits**}   (use alternate units)
  ⟨*environment content*⟩
\end{**usealternateunits**}

Inside these environments units are changed for the duration of the environment regardless of the global default setting.

```

3.2 Physical Constants

3.2.1 Typesetting Physical Constants

Take the quantity $\frac{1}{4\pi\epsilon_o}$, sometimes called the Coulomb constant, as the prototypical physical constant in an introductory physics course. Here are all the ways to access this quantity in mandi. As you can see, these commands are almost identical to the corresponding commands for physical quantities.

\oofpez

> Command for the Coulomb constant. The constant's numerical precision and default units will depend on the options passed to mandi at load time. Alternate units and approximate numerical values are the defaults. Other units can be forced as demonstrated.

\oofpezonlyalternateunits		$\mathrm{N \cdot m^2 \, / \, C^2}$

3.2.2 Checking Physical Constants

\checkconstant{⟨*name*⟩}

> Command to check and typeset the constant's name, base units, derived units, alternate units, mathematical symbol, approximate value, and precise value.

3.2.3 Commands For Predefined Physical Constants

Every other defined physical constant can be treated similarly. Just replace oofpez with the constant's name. Unfortunately, there is no universal agreement on the names of every constant so consult the next section for the names that have been used. Here are all the physical constants, with all their units, defined in mandi. The constants \coulombconstant$^{\rightarrow P. 23}$ and \biotsavartconstant are defined as semantic aliases for, respectively, \oofpez$^{\rightarrow P. 25}$ and \mzofp$^{\rightarrow P. 25}$.

4.1 The glowscriptblock Environment

```
\begin{glowscriptblock}[⟨options⟩](⟨link⟩){⟨caption⟩}
  ⟨GlowScript code⟩
\end{glowscriptblock}
```

Code placed here is nicely formatted and optionally linked to its source on GlowScript.org. Clicking anywhere in the code window will open the link in the default browser. A caption is mandatory, and a label is internally generated. The listing always begins on a new page. A URL shortening utility is recommended to keep the URL from getting unruly. For convenience, `https://` is automatically prepended to the URL and can thus be omitted.

GlowScript program 1 is nice. It's called A GlowScript program and is on page 31.

4.2 The `vpythonfile` Command

\vpythonfile[⟨*options*⟩]{⟨*file*⟩}{⟨*caption*⟩}

Command to load and typeset a VPython program. The file is read from {⟨*file*⟩}. Clicking anywhere in the code window can optionally open a link, passed as an option, in the default browser. A caption is mandatory, and a label is internally generated. The listing always begins on a new page. A URL shortening utility is recommended to keep the URL from getting unruly. For convenience, `https://` is automatically prepended to the URL and can thus be omitted.

```
\vpythonfile[hyperurl interior = https://vpython.org]{vdemo.py}
  {A \VPython\ program}
```

VPython Program 1: A VPython program

```python
from vpython import *

scene.width = 400
scene.height = 760
# constants and data
g = 9.8        # m/s^2
mball = 0.03   # kg
Lo = 0.26      # m
ks = 1.8       # N/m
deltat = 0.01 # s

# objects (origin is at ceiling)
ceiling = box(pos=vector(0,0,0), length=0.2, height=0.01,
              width=0.2)
ball = sphere(pos=vector(0,-0.3,0),radius=0.025,
              color=color.orange)
spring = helix(pos=ceiling.pos, axis=ball.pos-ceiling.pos,
               color=color.cyan,thickness=0.003,coils=40,
               radius=0.010)

# initial values
pball = mball * vector(0,0,0)     # kg m/s
Fgrav = mball * g * vector(0,-1,0) # N
t = 0

# improve the display
scene.autoscale = False        # turn off automatic camera zoom
scene.center = vector(0,-Lo,0) # move camera down
scene.waitfor('click')         # wait for a mouse click

# initial calculation loop
# calculation loop
while t < 10:
    rate(100)
    # we need the stretch
    s = mag(ball.pos) - Lo
    # we need the spring force
    Fspring = ks * s * -norm(spring.axis)
    Fnet = Fgrav + Fspring
    pball = pball + Fnet * deltat
    ball.pos = ball.pos + (pball / mball) * deltat
    spring.axis = ball.pos - ceiling.pos
    t = t + deltat
```

\VPython\ program \ref{vp:1} is nice.
It's called \nameref{vp:1} and is on page \pageref{vp:1}.

VPython program 1 is nice. It's called A VPython program and is on page 33.

4.3 The `glowscriptinline` and `vpythoninline` Commands

\glowscriptinline{⟨*GlowScript code*⟩}
\vpythoninline{⟨*VPython code*⟩}

Typesets a small, in-line snippet of code. The snippet should be less than one line long.

```
\GlowScript\ programs begin with \glowscriptinline{GlowScript 3.0 VPython}
and \VPython\ programs begin with \vpythoninline{from vpython import *}.
```

GlowScript programs begin with `GlowScript 3.0 VPython` and VPython programs begin with `from vpython import *`.

5 Commands for Writing Physics Problem Solutions

In addition to the glowscriptblock[→P.29] environment and the \vpythonfile[→P.32] command, the \glowscriptinline[→P.34] command, and \vpythoninline[→P.34] command mandi provides a collection of commands physics students can use for writing problem solutions. This new version focuses on the most frequently needed tools. These commands should always be used in math mode.

5.1 Traditional Vector Notation

\vec{⟨*symbol*⟩}[⟨*labels*⟩]   (use this variant for boldface notation)
\vec*{⟨*symbol*⟩}[⟨*labels*⟩]   (use this variant for arrow notation)

    Powerful and intelligent command for symbolic vector notation. The mandatory argument is the symbol for the vector quantity. The optional label(s) consists of superscripts and/or subscripts and can be mathematical or textual in nature. If textual, be sure to wrap them in \symup{...} for proper typesetting. The starred variant gives arrow notation whereas without the star you get boldface notation. Subscript and superscript labels can be arbitrarily mixed, and order doesn't matter.

```
\( \vec{p} \)                                    \\
\( \vec{p}_{2} \)                                \\
\( \vec{p}^{\symup{ball}} \)                     \\
\( \vec{p}_{\symup{final}} \)                    \\
\( \vec{p}^{\symup{ball}}_{\symup{final}} \) \\
\( \vec{p}^{\symup{final}}_{\symup{ball}} \) \\
\( \vec*{p} \)
```

$$\boldsymbol{p}$$
$$\boldsymbol{p}_2$$
$$\boldsymbol{p}^{\text{ball}}$$
$$\boldsymbol{p}_{\text{final}}$$
$$\boldsymbol{p}^{\text{ball}}_{\text{final}}$$
$$\boldsymbol{p}^{\text{final}}_{\text{ball}}$$
$$\vec{p}$$

\dirvec{⟨*symbol*⟩}[⟨*labels*⟩]   (use this variant for boldface notation)
\dirvec*{⟨*symbol*⟩}[⟨*labels*⟩]   (use this variant for arrow notation)

    Powerful and intelligent command for typesetting the direction of a vector. The options are the same as those for **\vec**.

```
\( \dirvec{p} \)                                    \\
\( \dirvec{p}_{2} \)                                \\
\( \dirvec{p}^{\symup{ball}} \)                     \\
\( \dirvec{p}_{\symup{final}} \)                    \\
\( \dirvec{p}^{\symup{ball}}_{\symup{final}} \) \\
\( \dirvec{p}^{\symup{final}}_{\symup{ball}} \) \\
\( \dirvec*{p} \)
```

$$\widehat{\boldsymbol{p}}$$
$$\widehat{\boldsymbol{p}}_2$$
$$\widehat{\boldsymbol{p}}^{\text{ball}}$$
$$\widehat{\boldsymbol{p}}_{\text{final}}$$
$$\widehat{\boldsymbol{p}}^{\text{ball}}_{\text{final}}$$
$$\widehat{\boldsymbol{p}}^{\text{final}}_{\text{ball}}$$
$$\widehat{p}$$

\zerovec   (use this variant for boldface notation)
\zerovec*   (use this variant for arrow notation)

    Command for typesetting the zero vector. The starred variant gives arrow notation. Without the star you get boldface notation.

```
\( \zerovec  \) \\
\( \zerovec* \)
```

$$\mathbf{0}$$
$$\vec{0}$$

\mivector[⟨*delimiter*⟩]{⟨$c_1, \ldots, c_n$⟩}[⟨*units*⟩]

Typesets a vector as either numeric or symbolic components with an optional unit (for numerical components only). There can be more than three components. The delimiter used in the list of components can be specified; the default is a comma. The notation mirrors that of *Matter & Interactions.*

```
\mivector{p_0,p_1,p_2,p_3}                            \\
\mivector{\gamma m v_x,\gamma m v_y,\gamma m v_z} \\
\mivector{\frac{Q_1Q_2}{x^2},0,0}                     \\
\mivector{-1,0,0}                                      \\
\mivector{-1,0,0}[\velocityonlyderivedunits]          \\
\mivector{-1,0,0}[\meter\per\second]                  \\
\velocity{\mivector{-1,0,0}}
```

$\langle p_0, p_1, p_2, p_3 \rangle$
$\langle \gamma m v_x, \gamma m v_y, \gamma m v_z \rangle$
$\left\langle \frac{Q_1 Q_2}{x^2}, 0, 0 \right\rangle$
$\langle -1, 0, 0 \rangle$
$\langle -1, 0, 0 \rangle \, \mathrm{m/s}$
$\langle -1, 0, 0 \rangle \, \mathrm{m/s}$
$\langle -1, 0, 0 \rangle \, \mathrm{m/s}$

\direction[⟨*delimiter*⟩]{⟨$c_1, \ldots, c_n$⟩}
\unitvector[⟨*delimiter*⟩]{⟨$c_1, \ldots, c_n$⟩}

Semantic aliases for \mivector.

```
\direction{\frac{1}{\sqrt{3}},\frac{1}{\sqrt{3}},\frac{1}{\sqrt{3}}} \\
\unitvector{\frac{1}{\sqrt{3}},\frac{1}{\sqrt{3}},\frac{1}{\sqrt{3}}}
```

$\left\langle \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}} \right\rangle$
$\left\langle \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}} \right\rangle$

\changein

Semantic alias for \Delta.

```
\( \changein t \) \\
\( \changein \vec{p} \)
```

Δt
$\Delta \boldsymbol{p}$

\doublebars[⟨*size*⟩]{⟨*quantity*⟩}   (double bars)
\doublebars*[⟨*size*⟩]{⟨*quantity*⟩}   (double bars for fractions)
\singlebars[⟨*size*⟩]{⟨*quantity*⟩}   (single bars)
\singlebars*[⟨*size*⟩]{⟨*quantity*⟩}   (single bars for fractions)
\anglebrackets[⟨*size*⟩]{⟨*quantity*⟩}   (angle brackets)
\anglebrackets*[⟨*size*⟩]{⟨*quantity*⟩}   (angle brackets for fractions)
\parentheses[⟨*size*⟩]{⟨*quantity*⟩}   (parentheses)
\parentheses*[⟨*size*⟩]{⟨*quantity*⟩}   (parentheses for fractions)
\squarebrackets[⟨*size*⟩]{⟨*quantity*⟩}   (square brackets)
\squarebrackets*[⟨*size*⟩]{⟨*quantity*⟩}   (square brackets for fractions)
\curlybraces[⟨*size*⟩]{⟨*quantity*⟩}   (curly braces)

\curlybraces*[⟨*size*⟩]{⟨*quantity*⟩} (curly braces for fractions)

If no argument is given, a placeholder is provided. Sizers like \big,\Big,\bigg, and \Bigg can be optionally specified. Beginners are encouraged not to use them. See the mathtools package documentation for details.

\[\doublebars{} \] \[\doublebars{\vec{a}} \] \[\doublebars*{\frac{\vec{a}}{3}} \] \[\doublebars[\Bigg]{\frac{\vec{a}}{3}} \]	$\lVert \cdot \rVert$ $\lVert \boldsymbol{a} \rVert$ $\left\lVert \dfrac{\boldsymbol{a}}{3} \right\rVert$ $\left\lVert \dfrac{\boldsymbol{a}}{3} \right\rVert$

`\colvec[⟨delimiter⟩]{⟨c_1, \dots, c_n⟩}`
`\rowvec[⟨delimiter⟩]{⟨c_1, \dots, c_n⟩}`

Typesets column vectors and row vectors as numeric or symbolic components. There can be more than three components. The delimiter used in the list of components can be specified; the default is a comma. Units are not supported, so these are mainly for symbolic work.

`\[ \colvec{1,2,3} \]`
`\[ \rowvec{1,2,3} \]`

`\( 3\timestento{8} \) \\`
`\( 3\xtento{8} \)`
	10^{-4}
	3×10^8
	3×10^8

5.2 Coordinate-Free and Index Notation

Beyond the current level of introductory physics, we need intelligent commands for typesetting vector and tensor symbols and components suitable for both coordinate-free and index notations.

\veccomp{⟨*symbol*⟩}	(use this variant for coordinate-free vector notation)
\veccomp*{⟨*symbol*⟩}	(use this variant for index vector notation)
\tencomp{⟨*symbol*⟩}	(use this variant for coordinate-free tensor notation)
\tencomp*{⟨*symbol*⟩}	(use this variant for index tensor notation)

    Conforms to ISO 80000-2 notation.

`\( \veccomp{r}  \) \\`
`\( \veccomp*{r} \) \\`
`\( \tencomp{r}  \) \\`
`\( \tencomp*{r} \)`
	$\boldsymbol{r}$
	r
	r
	r

\valence{⟨*index*⟩}{⟨*index*⟩}
\valence*{⟨*index*⟩}{⟨*index*⟩}

    Typesets tensor valence. The starred variant typesets it horizontally.

`A vector is a \( \valence{1}{0}  \) tensor. \\` `A vector is a \( \valence*{1}{0} \) tensor.`	A vector is a $\binom{1}{0}$ tensor. A vector is a $(1,0)$ tensor.

\contraction{⟨*slot,slot*⟩}
\contraction*{⟨*slot,slot*⟩}

Typesets tensor contraction in coordinate-free notation. There is no standard on this so we assert one here.

```
\( \contraction{1,2}  \) \\          ℂ_{1,2}
\( \contraction*{1,2} \)             C_{1,2}
```

\slot[⟨*vector*⟩]
\slot*[⟨*vector*⟩]

An intelligent slot command for coordinate-free vector and tensor notation. The starred variants suppress the underscore.

```
\( (\slot)  \)          \\          (___)
\( (\slot[\vec{a}])  \) \\          (_a_)
\( (\slot*) \)          \\          (   )
\( (\slot*[\vec{a}]) \)             ( a )
```

5.3 Problems and Annotated Problem Solutions

\begin{**physicsproblem**}{⟨*title*⟩}   (use this variant for vertical lists)
  ⟨*problem*⟩
\end{**physicsproblem**}
\begin{**physicsproblem***}{⟨*title*⟩}   (use this variant for in-line lists)
  ⟨*problem*⟩
\end{**physicsproblem***}

Provides an environment for stating physics problems. Each problem will begin on a new page. See the examples for how to handle single and multiple part problems.

```
\begin{physicsproblem}{Problem 1}
  This is a physics problem with no parts.
\end{physicsproblem}
```

Problem 1

This is a physics problem with no parts.

```
\begin{physicsproblem}{Problem 2}
  This is a physics problem with multiple parts.
  The list is vertical.
  \begin{parts}
    \problempart This is the first part.
    \problempart This is the second part.
    \problempart This is the third part.
  \end{parts}
\end{physicsproblem}
```

Problem 2

    \problempart This is the third part.
  \end{parts}
\end{physicsproblem*}
```

Problem 3

This is a physics problem with multiple parts. The list is in-line. **(a)** This is the first part. **(b)** This is the second part. **(c)** This is the third part.

```
\begin{physicssolution}                                    (use this variant for numbered steps)
  ⟨solution steps⟩
\end{physicssolution}
```
```
\begin{physicssolution*}                                   (use this variant for unnumbered steps)
  ⟨solution steps⟩
\end{physicssolution*}
```

This environment is only for mathematical solutions. The starred variant omits numbering of steps. See the examples.

```
\begin{physicssolution}
  x &= y + z \\
  z &= x - y \\
  y &= x - z
\end{physicssolution}
\begin{physicssolution*}
  x &= y + z \\
  z &= x - y \\
  y &= x - z
\end{physicssolution*}
```

$$x = y + z \tag{1}$$
$$z = x - y \tag{2}$$
$$y = x - z \tag{3}$$

$$x = y + z$$
$$z = x - y$$
$$y = x - z$$

\reason{⟨*reason*⟩}

Provides an annotation in a step-by-step solution. Keep reasons short and to the point. Wrap mathematical content in math mode.

```
\begin{physicssolution}
  x &= y + z \reason{This is a reason.}     \\
  z &= x - y \reason{This is a reason too.} \\
  y &= x - z \reason{final answer}
\end{physicssolution}
\begin{physicssolution*}
  x &= y + z \reason{This is a reason.}     \\
  z &= x - y \reason{This is a reason too.} \\
  y &= x - z \reason{final answer}
\end{physicssolution*}
```

$$x = y + z \quad \text{This is a reason.} \tag{4}$$
$$z = x - y \quad \text{This is a reason too.} \tag{5}$$
$$y = x - z \quad \text{final answer} \tag{6}$$

$$x = y + z \quad \text{This is a reason.}$$
$$z = x - y \quad \text{This is a reason too.}$$
$$y = x - z \quad \text{final answer}$$

When writing solutions, remember that the `physicssolution` environment is *only* for mathematical content, not textual content or explanations.

```
\begin{physicsproblem}{Combined Problem and Solution}
  This is an interesting physics problem.
  \begin{physicssolution}
    The solution goes here.
  \end{physicssolution}
\end{physicsproblem}
```

```
\begin{physicsproblem}{Combined Multipart Problem with Solutions}
  This is a physics problem with multiple parts.
  \begin{parts}
    \problempart This is the first part.
      \begin{physicssolution}
        The solution goes here.
      \end{physicssolution}
    \problempart This is the second part.
      \begin{physicssolution}
        The solution goes here.
      \end{physicssolution}
    \problempart This is the third part.
      \begin{physicssolution}
        The solution goes here.
      \end{physicssolution}
  \end{parts}
\end{physicsproblem}
```

\hilite[⟨*color*⟩]**{**⟨*target*⟩**}**[⟨*shape*⟩]

Hilites the desired target, which can be an entire mathematical expression or a part thereof. The default color is magenta and the default shape is a rectangle.

```
\begin{align*}
  (\Delta s)^2 &= -(\Delta t)^2 + (\Delta x)^2 + (\Delta y)^2 +
                  (\Delta z)^2 \\
  (\Delta s)^2 &= \hilite{-(\Delta t)^2 + (\Delta x)^2}[rounded rectangle] +

  (\Delta s)^{\hilite{2}[circle]} &= \hilite[green]{-}[circle]
              (\Delta t)^{\hilite[cyan]{2}[circle]}+
              (\Delta x)^{\hilite[orange]{2}[circle]} +
              (\Delta y)^{\hilite[blue!50]{2}[circle]} +
              (\Delta z)^{\hilite[violet!45]{2}[circle]}
\end{align*}
```

$$(\Delta s)^2 = -(\Delta t)^2 + (\Delta x)^2 + (\Delta y)^2 + (\Delta z)^2$$
$$(\Delta s)^2 = \boxed{-(\Delta t)^2 + (\Delta x)^2} + (\Delta y)^2 + (\Delta z)^2$$
$$(\Delta s)^2 = -(\Delta t)^2 + (\Delta x)^2 + (\Delta y)^2 + (\Delta z)^2$$
$$(\Delta s)^2 = -(\Delta t)^2 + (\Delta x)^2 + (\Delta y)^2 + (\Delta z)^2$$
$$(\Delta s)^2 = -(\Delta t)^2 + (\Delta x)^2 + (\Delta y)^2 + (\Delta z)^2$$

6 Commands Specific to *Matter & Interactions*

mandi comes with an accessory package mandiexp which includes commands specific to *Matter & Interactions*[2]. The commands are primarily for typesetting mathematical expressions used in the text. Use of mandiexp is optional and so must be manually loaded by including the line `\usepackage{mandiexp}` in your document's preamble.

6.1 The Momentum Principle

`\lhsmomentumprinciple`	(LHS of delta form, bold vectors)

7 Source Code

Definine the package version and date for global use, exploiting the fact that in a .sty file there is now no need for \makeatletter and \makeatother. This simplifies defining internal commands, with @ in the name, that are not for the user to know about.

```
1 \def\mandi@Version{3.0.0h}
2 \def\mandi@Date{2021-03-14}

7 \DeclareCurrentRelease{v\mandi@Version}{\mandi@Date}
8 \ProvidesPackage{mandi}
9   [\mandi@Date\space v\mandi@Version\space Macros for introductory physics]
```

Define a convenient package version command.

```
10 \newcommand*{\mandiversion}{v\mandi@Version\space dated \mandi@Date}

Set up the fonts to be consistent with ISO 80000-2 notation. The unicode-math package loads the fontspec and xparse packages. Note that xparse is now part of the LaTeX kernel. Because unicode-math is required, all documents using mandi must be compiled with an engine that supports Unicode. We recommend LuaLaTeX.

mandi now has a key-value interface, implemented with pgfopts and pgfkeys. There are two options:
units$^{\rightarrow\text{P.6}}$, with values **base**, **derived**, or **alternate** selects the default form of units
preciseconstants$^{\rightarrow\text{P.6}}$, with values **true** and **false**, selects precise numerical values for constants rather than approximate values.

First, define the keys. The key handlers require certain commands defined by the unit engine, and thus must be defined and processed after the unit engine code.

```
308 \newif\ifusingpreciseconstants
309 \pgfkeys{%
310   /mandi/options/.cd,
311   initial@setup/.style={%
312     /mandi/options/buffered@units/.initial=alternate,%
313   },%
314   initial@setup,%
315   preciseconstants/.is if=usingpreciseconstants,%
316   units/.is choice,%
317   units/.default=derived,%
318   units/alternate/.style={/mandi/options/buffered@units=alternate},%
319   units/base/.style={/mandi/options/buffered@units=base},%
320   units/derived/.style={/mandi/options/buffered@units=derived},%
321 }%
```

Process the options.

```
322 \ProcessPgfPackageOptions{/mandi/options}
```

Write a banner to the console showing the options in use. The value of the units$^{\rightarrow\text{P.6}}$ key is used in situ to set the default units.

```
323 \newcommand*{\mandi@linetwo}{\typeout{mandi: Loadtime options...}}

A better, intelligent coordinate-free `\vec` command. Note the use of the e{_^} type of optional argument. This accounts for much of the flexibility and power of this command. Also note the use of the TeX primitives \sb{} and \sp{}. Why doesn't it work when I put spaces around #3 or #4? Because outside of \ExplSyntaxOn...\ExplSyntaxOff, the _ character has a different catcode and is treated as a mathematical entity.

See https://tex.stackexchange.com/q/554706/218142.

Intelligent delimiters provided via the [mathtools](#) package. Use the starred variants for fractions. You can supply optional sizes. Note that default placeholders are used when the argument is empty.

```
912 \DeclarePairedDelimiterX{\doublebars}[1]{\lVert}{\rVert}{\ifblank{#1}{\:\cdot\:}{#1}}
913 \DeclarePairedDelimiterX{\singlebars}[1]{\lvert}{\rvert}{\ifblank{#1}{\:\cdot\:}{#1}}

Some semantic aliases. Because of the way \vec[→P. 35] and \dirvec[→P. 35] are defined, I reluctantly decided not to implement a \magvec command. It would require accounting for too mamy options. So \magnitude[→P. 38] is the new solution.
